

Framo Morat Polska. German quality at low costs.

Increasing cost pressure, capacity bottlenecks and lack of skilled workers are ever-present topics. Are you looking for alternative measures to sustainably improve your competitiveness in the assembly of your drive projects? Then we're the right fit for you!

Have we sparked your interest? We will gladly send you a customized quote in almost no time at all. We are looking forward to receiving your inquiries and your exciting projects!

✓ Reducing costs

Reduce your personnel costs significantly by outsourcing your assembly projects to our modern production facility in Nowa Ruda, Poland.

✓ Increasing your capacity

Our team of experts will pull out all the stops to ensure your project can be implemented on short notice. Overcome capacity bottlenecks and increase your productivity by focusing on your core business.

✓ Certified quality testing

Traceable, product-specific intermediate and final inspections as well as certified quality management in accordance with ISO 9001 ensure the reliability of all drive units.

✓ Many years of experience

There is no substitute for experience! Whether partially assembled components or complete drives—benefit from the expertise we have gained from numerous drive projects.

Framo Morat - your experienced partner for assembly projects.

Framo Morat has been at home in the world of gear and drive engineering for over 100 years. Our customers value us as experienced development partners for innovative drive systems, which we support from the specification phase to series production.

In our assembly plant founded in 2015 in Nowa Ruda, Poland, we offer you a modern infrastructure and qualified employees for your assembly tasks on 2,500 m² production and assembly area.

Our portfolio of drive solutions includes partially assembled components, standardized modular gearbox components and ready-to-use complete drives including a motor and control system. We use a wide variety of machining processes, product- and process-oriented tests as well as testing methods during assembly. This enables us to produce drive solutions that perform their reliable services in a variety of industries. Here are just a few:

Drives for curved stair lifts

The stair lift drive consists of a total of three individual drives: the main drive for the up and down movement, the swivel drive for the seat as well as the drive system for tilt correction.

Control valve drive

This plastic component controls induction devices and radiators. 15 different variants that are distinguished by lifting force and actuating power are manufactured from over 20 individual parts.

Planetary gears

We are also a competent partner for the assembly of standardized drive solutions. Based on the modular principle, planetary gears are assembled according to desired specifications.

Two-component mixing device for dental technology

This drive meters and mixes two viscous, paste-like substances at the push of a button. The drive consists of a total of 132 different individual parts—made of both metal and plastic.

Drives for caravan maneuvering systems

Maximum precision, durability and reliability are demanded when maneuvering caravans. For this purpose, the three-stage spur wheel drives undergo meticulous tests before delivery.

Control valve drive

These customer-specific drives activate control valves in long-distance heating pipe networks. We manufacture over 100 versions for different travels, actuating power, speed or operating voltages.
